Router Course

3-day Course

£515 inc VAT

The IBTC Router Course is an intensive, practical, 3-day course which initially covers the introduction to routers, router use and health and safety.

The course is then centred around building your own custom-made router table (or mini spindle moulder), which covers jig and pattern making, channelling, rebating, forming curved shapes and radius arcs, edge trimming, inline jigs for straight rebates and creating straight edges.

This course also covers the use of a wide range of cutters, both with and without bearing guides and their care and sharpening.

The end result is a router table that is custom made for your own router along with the skills and techniques required to make comprehensive use of your router. There is an emphasis on developing the inventiveness of the router operator in problem solving and customising patterns, jigs and the router itself to deal with a multitude of situations. It should be noted that though a router is a highly versatile tool that could be adapted for almost any situation, it is not always the most cost-effective approach, and sensible alternatives are suggested throughout the course.

Course requirements are that you have a router of 'trade' or 'industrial' capacity, with a half inch collett, and fine height adjustment capability.

Candidates require no previous experience, and as such we are happy to advise on choice of router purchase prior to the course do not hesitate to contact us.

The course will be run by our joinery instructor P J Hummell (and will be held in a designated area within our joinery workshop. Daily hours are from 8.00am to 4.30pm
